

Paper / Purpur — scale win (honest)

YaPcore does **not** claim single-thread MSPT victory over Paper/Purpur without a fair bench. The product win is **regionized scale + encyclopedia + suite**.

Why Paper/Purpur are a different class

	Paper / Purpur	YaPcore (YaP-Folia)
Tick model	One main thread	Region thread pool
Encyclopedia	Purpur <code>purpur.yml</code> (NMS fork)	YaP <code>knobs.yml</code> (plugin + optional Folia hooks)
Network / MMO	Assemble plugins	First-party CORE+NETWORK + GAMEPLAY
Crossplay	Geyser/Via jars	First-party dual-stack

Fair benches (product claim)

Use multi-region / high-pop scenarios where Folia-class servers are designed to win:

```
# Stock Paper/Purpur competitors (single-thread jars)
./scripts/bench/fetch-competitors.sh

# Multi-region style load on YaP-Folia ship knobs (existing Folia peer path)
./scripts/yapctl cite-fullcite

# Optional: document Paper/Purpur heavypop on same machine for operator context
# (not a Folia-apples MSPT cite – disclose single-thread vs regionized)
YAP_BENCH_COMPETITORS=paper,purpur ./scripts/bench/run-vs-paper-scale.sh heavypop 40
```

Operator takeaway

- Need **Purpur-class mob/QoL config** without leaving Folia → YaP Encyclopedia ([TUNE.md](#)).
- Need **100 concurrent active** with citeable MSPT → YaP-Folia ship knobs vs stock Folia/Canvas ([REAL_GAINS.md](#)).
- Need **max Paper plugin ecosystem** on one thread → Paper/Purpur (legacy benches only).

Results note (campaign)

Latest context stamp should be recorded under `bench/results/` and summarized here when operators run `./scripts/bench/run-vs-paper-scale.sh`. Until then, cite YaP vs Folia/Canvas for MSPT and this doc for the **product + scale** framing vs Paper/Purpur.

Non-claims

- Do not market “beats Purpur MSPT on single-thread farms” until `run-vs-paper-scale.sh` fixtures land with disclosed methodology.
- Do not imply Purpur source was ported — encyclopedia is original YaP code.
