

Crossplay & multi-version (full Geyser + Via parity — first-party)

YaPcore aims for **one shared world** and **full** protocol coverage:

- **Bedrock:** built-in Geyser **parity** (`GeyserStyleTranslator` / `CrossplayHub`) — not the Geyser jar
- **Older / other JE:** built-in `ViaVersion` + `ViaBackwards` + `ViaRewind` **parity** (`ProtocolCompat` / `ViaStyleRemapper`) — not `Via*` jars
- **Floodgate-class auth:** first-party `FloodgateAuth` / Xbox chain in core; behind Velocity use `yap-floodgate.jar` (not the Floodgate jar) — [VELOCITY.md](#)

Supported JE floor: **1.20.2+** onto Folia/Paper 26.2. Pre-1.19 / Rewind-depth is **best-effort**, not product DoD for play remaps. Live matrix (2026-08-21): JE **7/7** join/spawn under zlib; Bedrock smoke `geyserParitySmoke=true` on 1.21.50 (~1599 itemstates).

Phase 4 DoD is that parity on the Folia-backed world (product default). Slice roll-up: [CROSSPLAY.md](#). Feature-by-feature checklist: [CROSSPLAY.md](#). Bedrock terrain defaults to **column stream** from the game authority (P4.5); flat is opt-in (`-Dyapcore.bedrock.flat-chunks=true`).

Product note: With default `game-authority=folia` , **Folia** owns the JE game. Phase 3 Paper spatial tick is **not** product default (opt-in for Paper benches only; Folia path has no Phase 3 spatial tick). Phase 4 finishes dual-stack depth — join/spawn and core play depth are supported; some advanced Bedrock fidelity rows remain partial. See [YAPCORE_WHITEPAPER.md](#).

Streamlined one-port join

By default:

```
shared-listen-port=true
crossplay-enabled=true
port=25566
bedrock-port=25566
```

Edition	Socket (local bind)	Same-PC	Public (nginx / SRV)
Java	TCP :25566	127.0.0.1:25566	yapcoremc.yaplabs.us:25565
Bedrock	UDP :25566	127.0.0.1:25566	yapcoremc.yaplabs.us:25565

Same host **and** same **local** port number — OS allows TCP and UDP to share a port. With nginx, players on the internet use **25565**; the origin still listens on **25566**.

Disable with `shared-listen-port=false` to use a separate Bedrock UDP port.

Domain / Cloudflare: [CLOUDFLARE_AND_NGINX.md](#).

Architecture

On join, both editions register a `UnifiedPlayer` into the same shared world. Moves/chats/clicks are translated into shared engine ops.

Scope (Phase 4)

Target: full Geyser feature parity + full Via* feature parity in YaP code. **Join/spawn**

replace claim: JE matrix green + Bedrock smoke green — operators do **not** need Via* or Geyser jars for supported bands. Soft gameplay depth (richer BE metadata, block-state catalogs) still hardens from live clients.

GUI

- **Connect** — Crossplay address + Copy (local vs public ports)
- **Settings** — Shared listen port + Crossplay toggles
- **nginx** — domain `yapcoremc.yaplabs.us`, stream/HTTP ports, install script
