

Windows host guide — parity with Linux

YaPcore is meant to run **the same product** on Windows and Linux. Release trees:
`build/dist/yapcore-release/linux/` and `.../windows/` .

Requirements (both)

Need	Notes
JDK 25+	Folia 26.2
Git	Optional (checkout / contrib)

Launch

Linux	Windows
<code>./start.sh --fg</code>	<code>start.cmd -Fg</code>
<code>./gui.sh</code>	<code>gui.cmd</code>
<code>./stop.sh</code> / <code>./status.sh</code>	<code>stop.cmd</code> / <code>status.cmd</code>
<code>./start-prod.sh</code>	<code>start-prod.cmd</code>

Product path is **Folia** (`game-authority=folia`). YaP stays at the install root; the Folia child JVM uses `folia-kernel/` . Fetch with `./scripts/fetch-folia.sh` (Linux) before first boot if you want the jar pre-cached under `lib/` .

Retired: YaP Paperclip / Phase 3 vendor scripts (`Vendor-Paper.ps1` , `Build-Vendor-Paper.ps1` , `vendor-paper.sh` , `apply-yap-paper-hooks.sh`) are removed. Do not expect Paperclip build steps on Windows or Linux.

nginx edge — both platforms

Templates: `deploy/nginx/*.template` (shared).
Generated: `deploy/nginx/generated/` .

```
.\scripts\Nginx-Setup.ps1          # or nginx-setup.cmd in a release tree
```

Linux: `./scripts/nginx-setup.sh` .

MariaDB

```
.\scripts\Start-MariaDB.ps1
.\scripts\Configure-Db.ps1
.\scripts\Configure-PlayerData.ps1
```

See [MARIADB.md](#) · [PLAYERDATA.md](#).

Release packaging

`gradle assembleRelease` builds `build/dist/yapcore-release/windows/` with `scripts/*.ps1` and root `*.cmd` wrappers. No Paperclip wrappers are shipped.
