

# YaP Factions

---

Factions overlay on **YaPPlayerdata claims** without altering the `claims` table schema. Claim linkage lives in `yap_faction_claims` (claim\_id → faction\_id + power cost).

## Install

---

```
gradle :factions-plugin:installIntoPlugins
# or full core network:
gradle installProductDefaults
```

Requires `yap-db.jar`, `yap-playerdata.jar` (soft), and shared YaPDB.

## Commands

---

### Player ( /f )

| Command                                        | Description                          |
|------------------------------------------------|--------------------------------------|
| /f create <name> <tag>                         | Create faction                       |
| /f disband                                     | Leader disbands                      |
| /f join <faction>                              | Join (respects join mode)            |
| /f leave / /f kick <player>                    | Membership                           |
| /f invite <player> / /f accept\ deny <faction> | Invite flow                          |
| /f promote\ demote\ leader <player>            | Role management                      |
| /f desc <text> / /f motd [text]                | Description & MOTD                   |
| /f open\ closed\ inviteonly                    | Join mode (leader)                   |
| /f home\ sethome\ delhome                      | Faction home                         |
| /f chat [msg\ off] / /f allychat [msg\ off]    | Faction & ally chat                  |
| /f ally\ enemy\ neutral <faction>              | Relations                            |
| /f claim\ unclaim\ claimall                    | Link playerdata claim overlay        |
| /f members\ claims\ top [page]\ map            | Info views                           |
| /f deposit\ withdraw\ bank                     | Faction bank (YaPPlayerdata economy) |
| /f info\ list\ power                           | Status                               |

## Admin ( /yapfactions )

| Command                                                                        | Description             |
|--------------------------------------------------------------------------------|-------------------------|
| <code>/yapfactions reload</code>                                               | Reload config + service |
| <code>/yapfactions snapshot json</code>                                        | Dashboard live snapshot |
| <code>/yapfactions setpower &lt;faction&gt; &lt;power&gt; [max]</code>         | Set power               |
| <code>/yapfactions setjoin &lt;faction&gt; &lt;open\ invite\ closed&gt;</code> | Set join mode           |
| <code>/yapfactions disband &lt;faction&gt;</code>                              | Force disband           |

## Power

- $\text{max\_power} = \text{base-max} + \text{members} \times \text{per-member}$
- Claim overlay cost =  $\text{ceil}(\text{claim\_area} / \text{claim-blocks-per-power})$
- Available power =  $\text{max} - \text{sum}(\text{overlay costs})$
- Death power loss and periodic regen (configurable)
- Shield activates when power is depleted (blocks enemy build/PvP on territory)

## Roles

LEADER → OFFICER → MEMBER → RECRUIT

## Join modes

- OPEN** — anyone may `/f join`
- INVITE** — requires `/f invite` + `/f accept`
- CLOSED** — no public joins

## Claim integration

When a claim has a faction overlay:

- Build:** faction members (+ allies if configured) may build; claim owner still uses normal trust rules
- PvP:** same-faction blocked; allies blocked; enemies allowed on enemy-linked territory (configurable)
- Shield:** enemies blocked from building/PvP on shielded territory

## Placeholders (PlaceholderAPI)

| Placeholder            | Value           |
|------------------------|-----------------|
| %yapfaction_name%      | Faction name    |
| %yapfaction_tag%       | Faction tag     |
| %yapfaction_power%     | Available power |
| %yapfaction_max_power% | Max power       |
| %yapfaction_role%      | Player role     |
| %yapfaction_bank%      | Bank balance    |
| %yapfaction_shielded%  | Shield active   |

## Dashboard

---

GET /api/factions — read-only JSON (counts, preview, optional live snapshot).

## Smoke
