

YaPLagGuard

Per-chunk lag-machine governor for **YaP-Folia** (`folia-supported: true`). Cancels excess entity spawns, primed TNT, hopper moves, and redstone updates when a chunk is hot.

Runs on the product game path (`game-authority=folia` , `folia-jar-source=build`). Build with `./scripts/build-yap-folia.sh`.

Install

```
gradle installProductDefaults # → plugins/yap-lagguard.jar
# or included in assembleRelease
./scripts/start.sh --fg
```

Config (`plugins/YaPLagGuard/config.yml`)

Knob	Default	Notes
<code>enabled</code>	<code>true</code>	Master switch
<code>max-entities-per-chunk</code>	<code>72</code>	Soft density (items + mobs + projectiles)
<code>max-primed-tnt-per-chunk</code>	<code>8</code>	Cannon / dupe protection
<code>max-hopper-transfers-per-window</code>	<code>48 / 20 ticks</code>	Hopper clocks
<code>max-redstone-events-per-window</code>	<code>96 / 20 ticks</code>	Rapid redstone
<code>stats-write-interval-ticks</code>	<code>100</code>	Writes <code>stats.json</code> for Prometheus/dashboard
<code>log-trips</code>	<code>true</code>	Rate-limited trip logs

Survival (public): keep defaults or tighten TNT/entities slightly.

Creative / redstone lab: raise hopper + redstone windows (e.g. 256 / 512).

Anarchy: leave on — lag cannons trip TNT + entity budgets first.

Commands: `/yaplagguard status|reload` (`yaplagguard.admin`).

Metrics

- File: `plugins/YaPLagGuard/stats.json`
- Chassis scrape: `yapcore_lagguard_*` on `GET /metrics`
- Dashboard: `/api/status` → `observability.lagguard`
