

# YaP Map (yap-map)

---

Flat web map: Leaflet + PNG chunk tiles, served from the dashboard ( `/map/` ) or YaPcore pack HTTP when `http.use-yapcore-server: true`.

| Item        | Value                                                                               |
|-------------|-------------------------------------------------------------------------------------|
| Product jar | <code>plugins/yap-map.jar</code>                                                    |
| Config      | <code>plugins/YaPMap/config.yml</code>                                              |
| Tiles       | <code>plugins/YaPMap/map/tiles/{world}/0/{x}_{z}.png</code>                         |
| Markers     | <code>GET /map/markers.json</code> (live players; optional NPC/region on dashboard) |

## Wave 4 scope

---

- Flat tile map + **live player markers**
- Optional **NPC / region** overlays (dashboard path when toggled)
- Dashboard Map tab: render schedule, worlds, marker toggles

**Not in Wave 4:** BlueMap-style **3D** mesh / isometric viewer. That is **Stretch / out until later**. YaP Map is the Dynmap/BlueMap *flat* replacement, not a 3D parity clone — see [PLUGIN\\_COMPAT\\_MATRIX.md](#).

## Markers config

---

```
markers:
  players: true
  npcs: false      # needs yap-npcs; enriched on dashboard /map/markers.json
  regions: false   # needs yap-regions
  poll-seconds: 5
```

Leaflet polls `/map/markers.json`. Coordinates map to the sampled chunk grid (origin corner `0...sample-chunk-radius`). Players outside that window will not appear on the current tile plane.

## Commands

---

```
/yapmap reload|render
```
