

YaPcore release notes

Product version **1.0.0.0** · YaP Link **0.6.0-phase6** · YaP-Folia **26.2**

For build commands and zip layout see [RELEASES.md](#). For live status see [YAPCORE_WHITEPAPER.md](#).

v1.0.0.0 — 2026-09-02

First shippable **YaP-Folia** network product release. This is the starting version — all first-party artifacts stay on **1.0.0.0**. Native plugin stack, first-party Java + Bedrock crossplay, YaP Link proxy, web dashboard, and the operator SMP commands below.

Highlights

Area	What shipped
Game authority	YaP-Folia 26.2 (folia-jar-source=build) — regionized tick, not stock Paper/Folia
Crossplay	First-party ViaBackwards-class JE (1.20.2+) + Geyser-class Bedrock — no Via* / Geyser jars
Network	YaP Link native proxy, dual-stack gateway, Floodgate-class identity; offline-mode Mojang skins
Plugins	Full CORE+NETWORK stack: perms, chat, moderation, essentials, claims, regions, protect, world, tab, discord, guard, map, NPCs, ...
Operator SMP	/bag (3/5/7/9 pages), /gm + /item , /eco , per-rank name/chat colors, /yapmod seen
Gameplay (in the full box)	MMO (100 quests, 20 bosses, abilities book + hotbar), vehicles, stacker, factions, guilds
Ops	Web dashboard (:8080) — ranks, kit builder, plugin YAML editors, Swing GUI, seed defaults, MariaDB Docker package
Clients (optional)	Fabric 26.2: yap-visuals (Sodium+Iris+shaders in one jar), yap-bag , yap-ultrawide — vanilla and Bedrock stay supported without them
Packs	yapcore-default (Faithful + skies + vehicles + MMO icons)
Integrations	Optional fetch scripts for Grim AC and Tebex (GPLv3, not bundled by default)

Protocol & crossplay

- **JE matrix 4/4 spawn** under compression (1.20.4, 1.21.1, and pinned mid bands).
- **Optional resource packs** auto-acked when `resource-pack-forced=false` — fixes mid-client join timeouts.
- **Bedrock 1.21.50** — RakNet login, spawn, dig/place, chat, commands; play-depth smoke green.
- **Paper column stream** default for Bedrock terrain (flat chunks opt-in only).
- **G.33** placed-skull block-actor sync + item-in-hand SkullOwner Name NBT; full profile-hash textures remain Stretch.
- Limitations documented in [CROSSPLAY.md](#).

Ops & configuration

- `config/defaults/` + `./scripts/seed-defaults.sh` — LAN-friendly first boot.
- [SECRETS.md](#) — where owners set MariaDB passwords, dashboard token, Discord webhooks, forwarding secret.
- **Web dashboard** — ranks (name/chat colors), kit builder, players, regions, guard, map, Discord, Link, packs, plugin YAML editors.
- **Release zips** ship defaults/examples only — live operator tokens are never packaged.
- **Privacy / terms templates** for public server operators: [PRIVACY_POLICY.md](#), [TERMS_OF_USE.md](#).

Tier 4 & roadmap closure

Completion backlog **Tiers 1-4 Done** (with live-soak caveats):

- Tier 1: YaPTab sidebar, claim flags, admin menus, combat PvE defaults.
- Tier 2: Dashboard polish, web map, Discord relay, tune docs.
- Tier 3: RS quest/boss roster, abilities, Bedrock skill UI, TAB cross-server sync.
- Tier 4: Protocol phases 4A→4F — dual-stack join, Bedrock play depth, limitation docs.

Roadmap phases **8-17 Done** (dashboard, TAB, Discord, regions, map, guard, NPCs, Bedrock depth, release polish).

Build & install

```
./scripts/build-yap-folia.sh
gradle publishReleasesFolder
# → releases/1.0.0.0/yapcore-release-linux.zip (+ windows, suite zips)

cd releases/1.0.0.0/yapcore-release/linux
cp deploy/mariadb/.env.example deploy/mariadb/.env # edit passwords
./configure-db.sh --server-id lobby
./start.sh --fg
```

Gameplay (vehicles, stacker, MMO) is included in the full box. Slim CORE+NETWORK:
`gradle assembleRelease -PyapGameplay=false`.

Breaking / migration notes

From	To
Stock Folia / Paper as default	YaP-Folia — rebuild with <code>./scripts/build-yap-folia.sh</code>
ViaVersion + Geyser + Floodgate jars	Remove — use built-in protocol stack
LuckPerms / EssentialsX / TAB / DiscordSRV	Optional — native YaP plugins cover typical SMP
Tracked <code>folia-kernel/server.properties</code>	<code>server.properties.example</code> — live file gitignored; seeded on first start
Bench JSON in repo	Removed — results are local/gitignored

Known limitations (honest)

Not blockers for release; documented for operators:

- **Retail Xbox / full inv UI** — validate with real clients before marketing “full play depth.”
- **ViaRewind 1.8 play depth** — out of product scope.
- **Smithing / sounds / particles** on older JE clients — same class of issues as ViaBackwards; see limitations doc.
- **YaPGuard** — lightweight native AC; use optional **Grim** for gold-standard checks.

Contributors & license

YaPcore first-party code: **GNU GPLv3** — see [LICENSING.md](#).
Not affiliated with Mojang, Microsoft, ViaVersion, or GeyserMC.

Earlier milestones (pre-1.0.0.0)

Summarized from git history; not separate tagged releases.

Period	Themes
Link 0.6	Native Velocity-class proxy phases 0–6; frame+zlib encoder fixes; link plugin suite
YaP-Folia fork	Managed Folia 26.2 build, sched compat agent, teleport transactions, region pool knobs

Period	Themes
MMO content	Tiered quest compendium (100 quests, 20 bosses), ability VFX, CLAY_BALL icon pack
World & admin	YaPWorld in-game edit GUI, admin menu, kits, claim flags, regions plugin
Docs regroup	<code>docs/</code> topic folders, PDF export, whitepaper v0.3

After 1.0.0.0 (same version — not a bump)

Product stays on **1.0.0.0**. Rebuild / republish artifacts with `gradle publishReleasesFolder` when cutting a refreshed zip; do **not** change Gradle `version` until a real tag bump.

Shipped on 1.0.0.0 line (post-tag refresh)

Area	Change
YaPWorld	FAWE-class phases 1-4: masks/patterns, <code>//sel</code> , biomes/terrain/brushes, parallel chunks, <code>//fast</code> , <code>.yschem v3</code> (tile-NBT + entities), <code>EditApplyService</code> , <code>WorldEdit.jar</code> API shim, <code>WorldEditCUI</code> , multi-clipboard, optional clipboard-web — YAPWORLD.md
YaPTab	Folia-safe Bukkit scoreboard sidebar (removed megavex packet path that kicked on join)
YaPChat	Secure-chat login rewrite fixed for YaP-Folia 26.2 (<code>ClientboundLoginPacket</code>)
Economy	Native <code>PlayerDataService</code> balance (deposit/withdraw/set) — crafting <code>/sell</code> , games rewards drop Vault fallback
Dashboard	Kit builder, player eco/perm actions, Tebex/plugin YAML editors, friendlier forms
Packs / clients	YaP Abilities icons in default pack; skies/water texture refresh; optional yap-visuals / Iris / Sodium client stack docs
Mechanics	Optional water-wave visuals
Ops docs	Public hostname <code>yapcoremc.yaplabs.us</code> , packs via nginx <code>:80</code> , grey-cloud game DNS
Ability VFX (V1-V4)	Engine primitives (<code>at:</code> , shake, arcs, motion trails, new shapes), element/archetype kits for 227 bulk abilities, 12 hero casts, unique icons, Folia soak gates — MMO_ABILITY_VFX.md
Ops Waves 1-5	Folia-safe pregen/protect/regions; Bedrock inventory fidelity; quest PLAYTIME/ECONOMY/... objectives; Discord event webhooks; map markers; dashboard Access context/temp + social/stacker panels; cite fixtures —5.53% fullcite (peak —12.4%) — REAL_GAINS.md

Still open (not a version bump)

- Manual §E live checklist ([CROSSPLAY.md](#))
- Next-protocol dump when Mojang ships a new JE build ([VANILLA_CLIENTS.md](#))
- YaPWorld NMS section placement / FAWE CFI (intentionally out of scope)
- Finish live **12h soak-long** + in-game VFX smoke before marketing the refreshed zip as soak-proven

1.0.0.0 remains the ship version. Bump only when cutting a later tagged release.
